

## **Elite Granite Care Guide**

### *General and Everyday Cleaning*

- We recommend using the Cif Power and Shine Kitchen Spray for everyday general cleaning, this will keep the worktops looking as good as the day they were installed. Please follow the instructions on the bottle to maximise the potential of the product.

### *Worktops look dull or marks on worktop*

- This tends to be a build-up of product. For example, if antibacterial spray or washing up liquid is used repeatedly on the worktops, this can lead to the product sitting on the surface and a build-up of residue that may look like stains or marks. We recommend using a product called Cif Power and Shine Kitchen spray. This product provides much more of a deep clean. After 2 or 3 uses, you should notice that the marks and build up disappears.

### *Limescale build-up*

- Pour white vinegar on the limescale and leave it to soak for 30 minutes. Rub gently with a non-scratch scotch bright sponge using wide strokes, then rinse with plenty of water. If necessary, repeat until the limescale is removed.

### *Drainage groves*

- Integrated drainage groves next to the kitchen sink are created mainly for an aesthetic purpose. This can mean they don't drain as well a traditional kitchen sink drainer. Over time residue can build up in the groves, which will affect their general performance. We recommend cleaning them with Cif Power and Shine spray and a non-scratch Scotch Bright Sponge.

### *Metal Marks*

- Metal objects such as knives, metal pots, keys and belt buckles can sometimes leave metal residue on the surface. This is as easy to remove by rubbing gently with a rubber/eraser.

*Below are images of the products we recommend; these can be found in all major supermarkets.*
